

Object-Oriented Design

Introduction to Software Design

It's still about tradeoffs.

Some things we'd like to be true

- ❑ My teammate and I can each **add a feature** in parallel without us colliding or stopping to talk
- ❑ When I test my code, nobody else's code needs to work or even be written

Modularity is about Teamwork!

- ❑ Easy to find **where to add code** to add a feature
- ❑ **Mostly adding code** and not modifying code
- ❑ Easy to understand the class I do have to **change**

Good software design gets us close to these ideals

And yes, we'll be making a big project feel small

A Concise Theory of Object-Oriented

- Object represents a “thing”
 - *person, car, date, ...*
 - (not two things, not $\frac{1}{2}$ a thing)
- Object responds to *messages*
 - (method calls)
 - *Things it does to itself*
 - That is, other objects ask the object to do something to itself, with msg
- Objects are “opaque”
 - Can't see each others' data/vars
 - Messages (calls) are only way to get things done

A Concise Theory of Object-Oriented, II

class

- Because object is completely opaque, others don't need to know what's really inside it
 - Each car object could be implemented with its own unique code
- If two cars behave the same, then really *should* have same code
 - Otherwise a huge amount of coding
 - Each one would have to be tested
 - Creates a maintenance nightmare
- So all cars are made from a common car *template*
 - Template = class
 - The car template is not a car, it's a “blueprint” for a car

Thing-ness Simplified:

The **S**ingle **R**esponsibility **P**inciple (**SRP**)

- A class should be responsible for 1 thing (thing, capability, computation, etc.)
- Can phrase as “*mind your own business*”
 - object does its own calculations
 - object should not do calculations for another
- Easy to violate this because objects need to be connected to one another
 - If you want something done, you just do it (oops)

Un-thing-ness: cramming related functionality into a single class

Automobile

```
+ start():void  
+ stop():void  
+ changeTires  
+ drive():void  
+ wash():void  
+ checkOil():  
+ getOil():int
```

It makes sense that the automobile is responsible for starting and stopping. That's a function of the automobile.

An automobile is NOT responsible for changing its own tires, washing itself, or checking its own oil.

SRP Analysis for Automobile

The Automobile	start[s]	itself.
The Automobile	stop[s]	itself.
The Automobile	changesTires	itself.
The Automobile	drive[s]	itself.
The Automobile	wash[es]	itself.
The Automobile	check[s] oil	itself.
The Automobile	get[s] oil	itself.

You may have to add an "s" or a word or two to make the sentence readable.

Follows SRP

☒

☐
☐
☐
☐
☒

Violates SRP

☐
☐
☒
☒
☒
☒
☐

You should have thought carefully about this one, and what "get" means. This is a method that just returns the amount of oil in the automobile—and that is something that the automobile should do.

This one was a little tricky—we thought that while an automobile might start and stop itself, it's really the responsibility of a driver to drive the car.

SRP design has separate classes for “do-ers”

One big class into four smaller ones = making a big project act like a small one

The four misplaced methods

This is called *Refactoring*.

New Design is Better

- For change, you know **where to find** code
 - Changing Mechanic stuff? Look in Mechanic
 - In old design, could overlook Automobile, means bug
- Only **one locus of change**
 - Don't have to think about, or change, Automobile and Mechanic
 - Simpler change, fits on screen, less chance of bug
 - Can think of your big program as bunch of small ones
- Design matches world, so **easier to understand**
 - More later

People are Complicated

Consider this Java class, which is using good naming conventions to convey the meanings of the methods:

```
class Person {  
    public void rainOn();  
    public boolean isWet();  
    public String getSpouseName();  
    public boolean isLeftHanded();  
}
```

Which methods are SRP?

- A. `rainOn()`, `isLeftHanded()`
- B. `isWet()`, `getSpouseName()`
- C. `isWet()`, `isLeftHanded()`
- D. `getSpouseName()`, `isLeftHanded()`

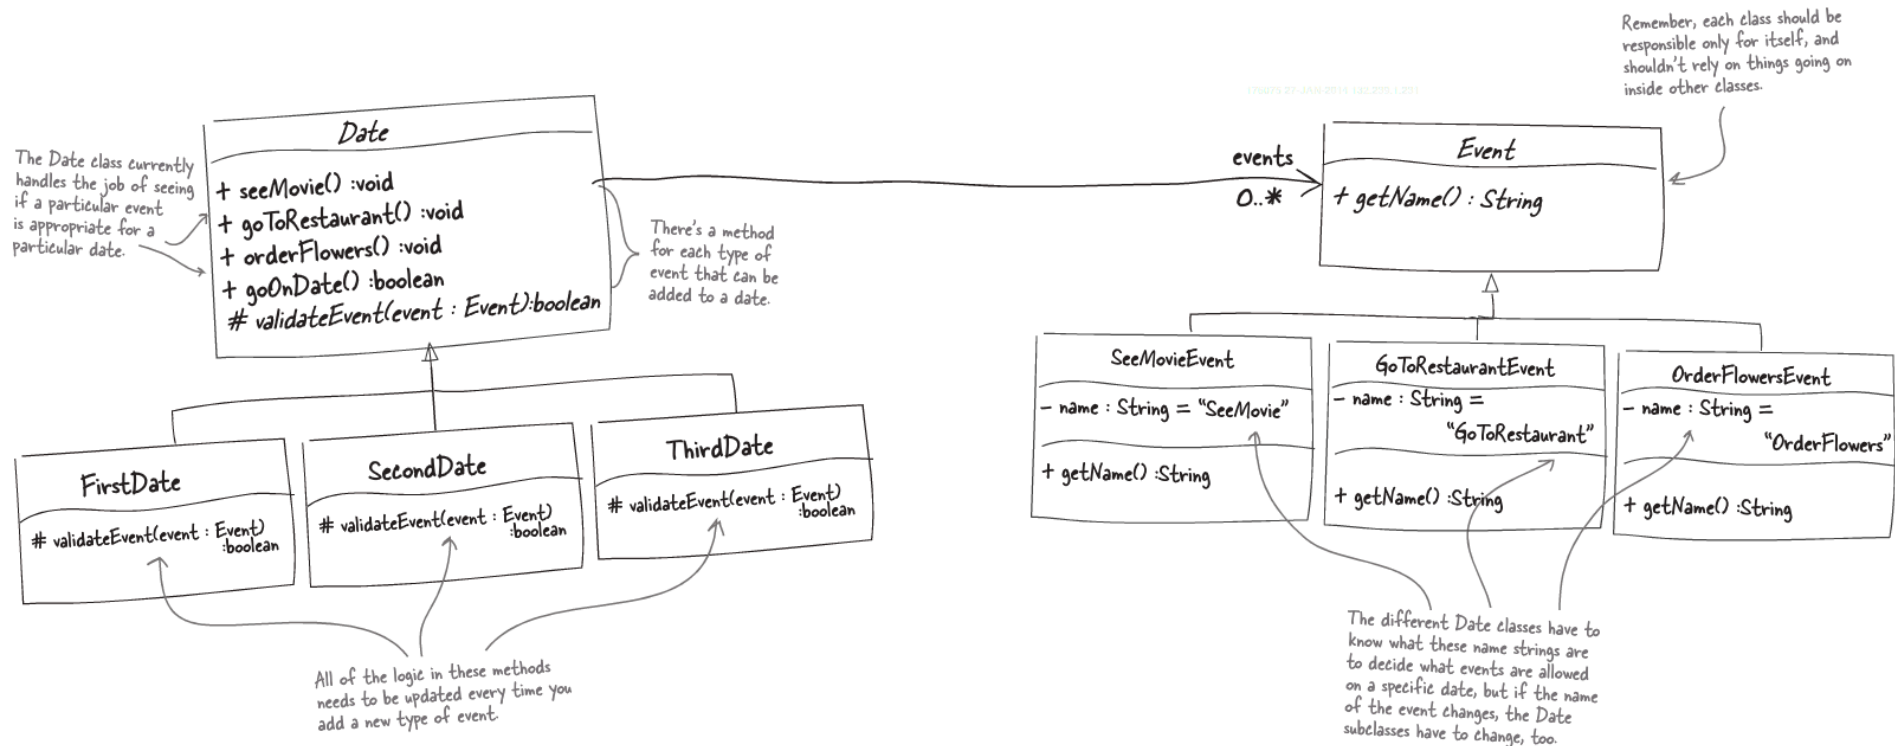

It is tempting, but the fact that we're getting the name from the Spouse object is the giveaway: the Spouse should be asked for its name directly. (Later we'll see that the spouse shouldn't be stored in the Person class at all.)

Thing-ness Simplified:

Don't Repeat Yourself (**DRY**)

- Each “thing” or computational idea should be expressed just once
- Violations are often the result of:
 - cut-and-paste programming
 - incomplete class (others have to do calculations for it, which also violates SRP)
- But also over-specialization of classes (implement object as a class)

Un-thing-ness: over-collaborating classes

```
class Date {  
  
protected static ArrayList<String> allowedEvents; /* override in sub */  
protected ArrayList<Event> events = new ArrayList<Event>();  
  
public void seeMovie() {  
    Event event = new seeMovieEvent();  
    if (validateEvent(event))  
        events.add(event);  
    else  
        throw eventNotAllowedOnDateEvent(event, this);  
}  
  
public void goToRestaurant() {  
    Event event = new goToRestaurantEvent();  
    if (validateEvent(event))  
        events.add(event);  
    else  
        throw eventNotAllowedOnDateEvent(event, this);  
}  
  
public void orderFlowers() {  
    Event event = new orderFlowerEvent();  
    if (validateEvent(event))  
        events.add(event);  
    else  
        throw eventNotAllowedOnDateEvent(event, this);  
}  
  
public boolean goOnDate() { /* important code here */ }
```

Repetition
(violates
DRY)

```
protected boolean validateEvent(Event event) {  
    for (String eventName : allowedEvents)  
        if (eventName.equals(event.getName())) return true;  
    return false;  
}
```

This code violates SRP. Why?

```
class FirstDate extends Date {  
  
    protected static ArrayList<String> allowedEvents =  
        new ArrayList<String>(Arrays.asList("SeeMovie", "GoToMovie"));  
  
    public FirstDate() {}  
  
}  
  
class SecondDate extends Date {  
  
    protected static ArrayList<String> allowedEvents =  
        new ArrayList<String>(Arrays.asList("SeeMovie", "GoToMovie", "OrderFlowers"));  
  
    public SecondDate() {}  
  
}  
  
class ThirdDate extends Date {  
  
    protected static ArrayList<String> allowedEvents =  
        new ArrayList<String>(Arrays.asList("SeeMovie", "GoToMovie", "OrderFlowers"));  
  
}
```

```
protected boolean validateEvent(Event event) {  
    for (String eventName : allowedEvents)  
        if (eventName.equals(event.getName())) return true;  
    return false;  
}
```

It's OK to call Event method, but not
**calculating on event data to derive event
property**

```
class FirstDate extends Date {  
  
protected static ArrayList<String> allowedEvents =  
    new ArrayList<String>(Arrays.asList("SeeMovie", "GoToMovie"));  
  
public FirstDate() {}  
}
```

Responsibility for
Events (violates SRP)

```
class SecondDate extends Date {  
  
protected static ArrayList<String> allowedEvents =  
    new ArrayList<String>(Arrays.asList("SeeMovie", "GoToMovie", "OrderFlowers"  
));  
  
public SecondDate() {}  
}
```

Also note that the only
difference between subclasses
is a constant data value

```
class ThirdDate extends Date {  
  
protected static ArrayList<String> allowedEvents =  
    new ArrayList<String>(Arrays.asList("SeeMovie", "GoToMovie", "OrderFlowers"  
));  
}
```

```
class Event {  
protected static String name;  
public String getName {  
    return name;  
}  
  
class SeeMovieEvent extends Event {  
protected static String name = "SeeMovie";  
public SeeMovieEvent() {}  
}  
  
class GoToRestaurantEvent extends Event {  
protected static String name = "GoToRestaurant";  
public GoToRestaurantEvent() {}  
}  
  
class OrderFlowersEvent extends Event {  
protected static String name = "OrderFlowers";  
public OrderFlowersEvent() {}  
}
```

Repetition
(violates
DRY)

Also note
that only
difference in
subclasses is
a constant

Refactored Date Class

~/documents/110/iSwoon/RefactoredForSRPandDRY

```
class Date {  
    protected int dateNum;  
    protected ArrayList<Event> events = new ArrayList<Event>();  
  
    protected Date(int dateNumber) {  
        dateNum = dateNumber;  
    }  
  
    public void addEvent(Event event) {  
        if (event.dateSupported(dateNum))  
            events.add(event);  
        else  
            throw eventNotAllowedOnDateEvent(event, this);  
    }  
  
    public boolean goOnDate() { /* important code here */ }  
}
```

Number instead of
class for each date!

Replaces 3
Event
constructors

Refactored Event

String, not class for each event!

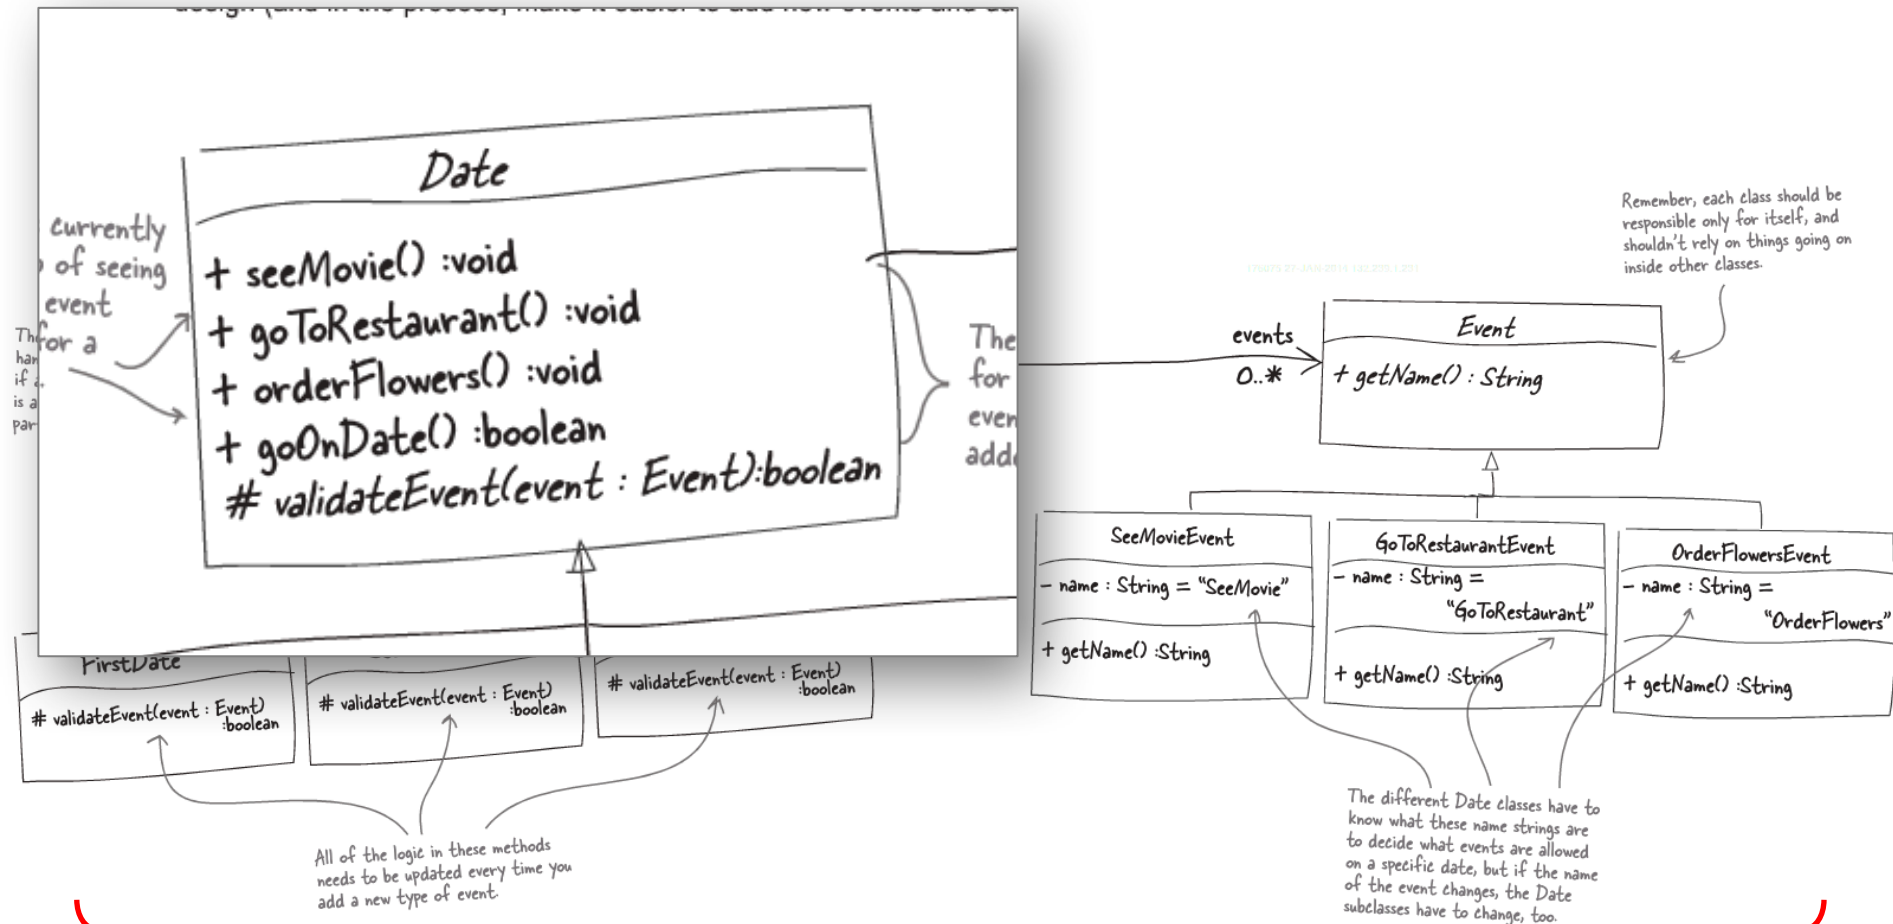

```
class Event {  
    protected String name;  
    protected int firstAllowedDate = Integer.MAX_VALUE; // fail hard if no init  
  
    public Event(int eventsFirstAllowedDate, String eventName) {  
        firstAllowedDate = eventsFirstAllowedDate;  
        name = eventName  
    }  
  
    protected boolean dateSupported(int dateNumber) {  
        return dateNumber >= firstAllowedDate;  
    }  
  
    /**  
     * static Factory methods, for convenience and correctness.  
     * Note that Date can't even tell if Event has subclasses.  
     */  
    public static Event makeSeeMovie() { return new Event(1, "SeeMovie"); }  
    public static Event makeGoToRestaurantEvent() {  
        return new Event(1, "GoToRestaurant");  
    }  
    public static Event makeOrderFlowers() {  
        return new Event(2, "OrderFlowers");  
    }  
}
```

} Moved from
Date to get SRP.

} "Factory"
Methods
keep Event
details local

Rewind:

Now we can **see** symptoms in the UML

These classes sound like objects

```
class Event {  
    protected String name;  
    protected int firstAllowedDate = Integer.MAX_VALUE; // fail hard if no init  
  
    public Event(int eventsFirstAllowedDate, String eventName) {  
        firstAllowedDate = eventsFirstAllowedDate;  
        name = eventName  
    }  
  
    protected boolean dateSupported(int dateNumber) {  
        return dateNumber >= firstAllowedDate;  
    }  
}
```

} But now **date** functionality here! Why OK?

Which of these is a wrong justification for dateSupported(int) is OK in Event, but validateEvent(Event) is not OK in Date?

- A. The only thing that's going to use a Date is an Event
- B. Because whether an Event is allowed is a property of the Event itself, not the Date
- C. dateSupported is computing on an int, not a Date
- D. You wouldn't have to change any code if you were to add another valid Event

Design *Diagnosis* Review

- Three common mistakes in design
 - **TOO MUCH**: Put all X-related functionality in class X (Automobile)
 - **TOO FRIENDLY**: Blending of closely related classes (Date & Event)
 - **TOO LITTLE**: Defining class that has only one object (Date & Event)
- **SRP**: The Single Responsibility diagnostic
 - Do the “____ itself” test on methods
 - A change in one class causes change in another class
- **DRY**: The Don't Repeat Yourself diagnostic
 - Repetitive code
 - A “small” change requires many similar changes across methods or classes
- **Constant Classes**: Only diff. between classes is constants (same methods)

Design *Repair* Review

- For SRP-violating functionality
 - Create additional classes, move violations there (Automobile)
 - Move into existing classes (Date & Event)
- For DRY-violating functionality
 - Create new method out of repetitive code, call it
- For repetitive/constant classes
 - Merge repetitive, similar classes and encode differences with variables
 - `static String name = "SeeMovie";` → `String name;`

Take-Aways from Class Today

- Object-oriented design is intuitive, but subtle
 - **Java is just a tool, does not guarantee good design**
 - (Just because I have an expensive camera does not make me a good photographer :)
 - Easy to put functionality in wrong place, make classes too big, or make too small
- Possible to diagnosis and repair a design **before** or **after** the coding (may require both)
 - **SRP**: shared responsibility requires two classes to change together
 - **DRY**: duplicated code requires multiple methods/classes to change **[to be continued]**
- Unfortunately, there are many kinds of design mistakes, and unique repairs for them
