

How the Customer explained it

What the Project Manager understood

How the Analyst designed it

What the Programmer wrote

What the Business Consultant presented

How the Project was documented

What Operations installed

How the Customer was billed

How the Solution was supported

What the Customer really needed

Lecture 2: Intro To Process

Milestones, Estimation, Planning

CSE 210, Winter 2023

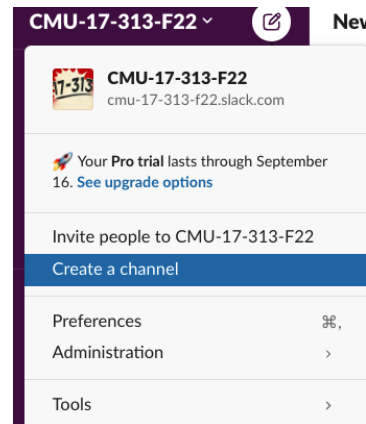

Slides adapted from CMU 17-313 (credit to Michael Hilton and others)

Learning Goals

- Today:
 - Recognize the importance of process
 - Understand the difficulty of measuring progress
 - Identify why software development has project characteristics
 - Use milestones for planning and progress measurement
- Friday:
 - Understand backlogs and user stories

Administrivia

- Due Friday:
 - Team formation survey
 - #FinAid assignment
 - Reading response
- I hope you all stay
 - But if you're going to drop, please do so by Friday

Create a private channel

Channels are where your team communicates. They're best when organized around a topic — #marketing, for example.

Name

team-foobar

Description (optional)

Channel for project team Foo Bar

What's this channel about?

Make private

This can't be undone. A private channel cannot be made public later on.

Create

Software Process

“The set of activities and associated results that produce a software product”

Sommerville, SE, ed. 8

How the Customer explained it

What the Project Manager understood

How the Analyst designed it

What the Programmer wrote

What the Business Consultant presented

How the Project was documented

What Operations installed

How the Customer was billed

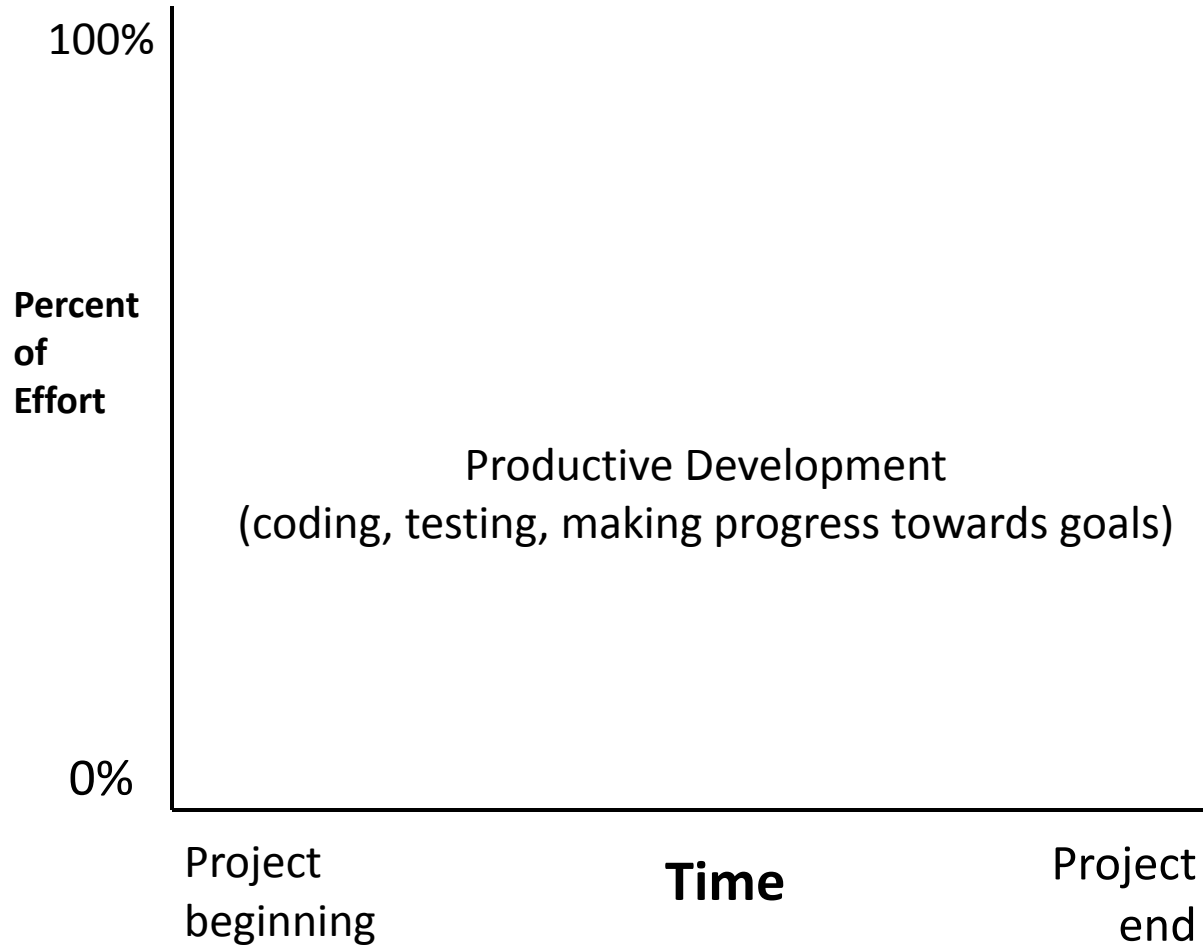

How the Solution was supported

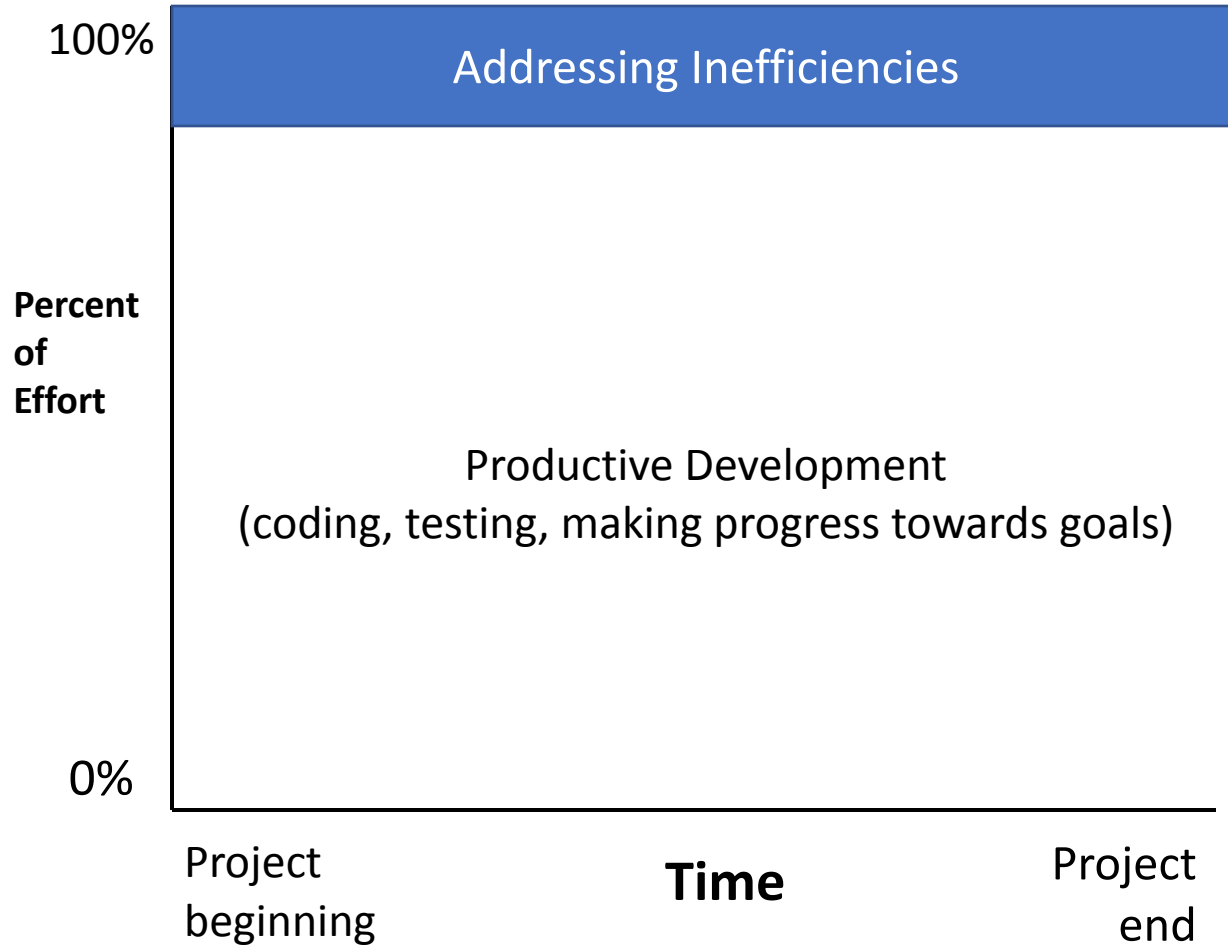

What the Customer really needed

How to develop software?

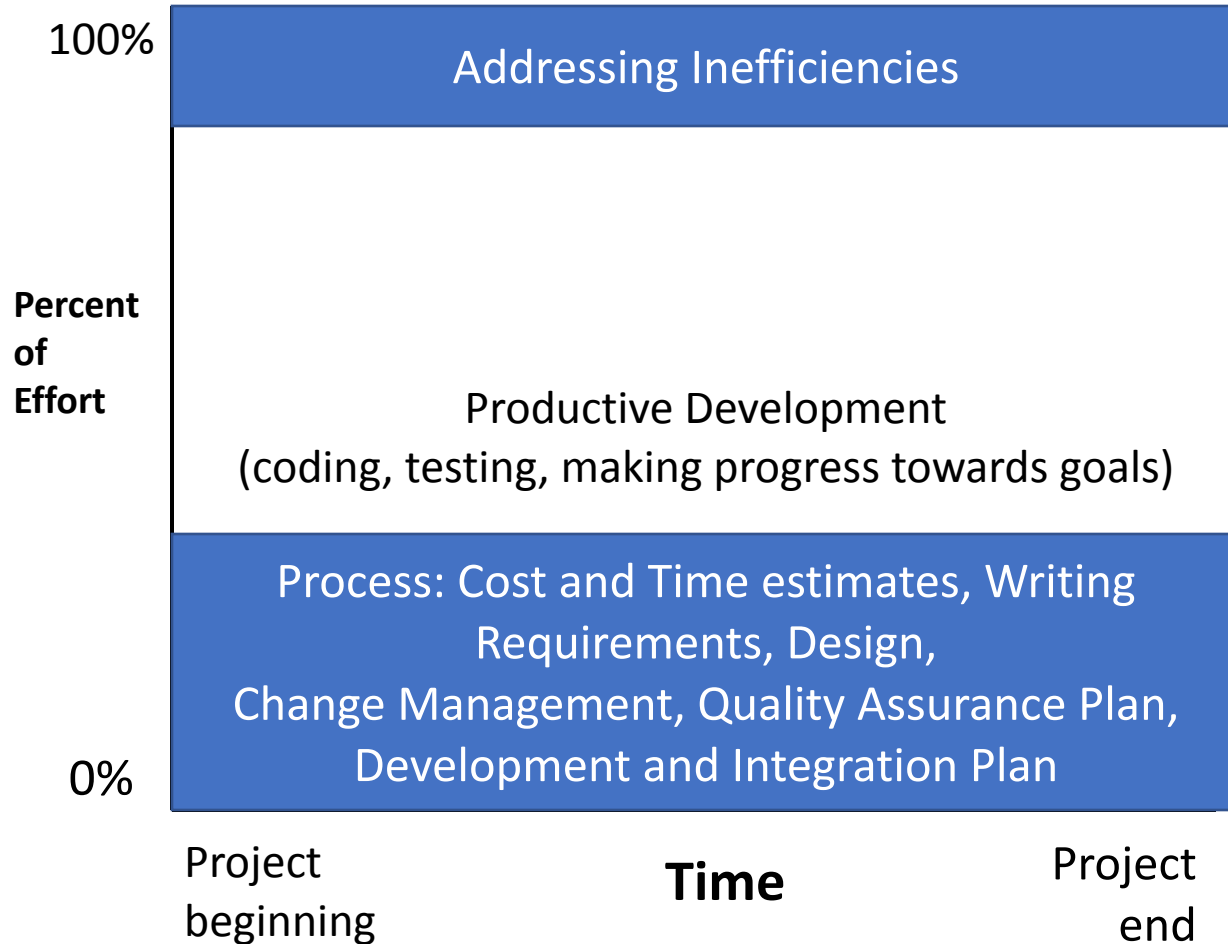

1. Discuss the software that needs to be written
2. Write some code
3. Test the code to identify the defects
4. Debug to find causes of defects
5. Fix the defects
6. If not done, return to step 1

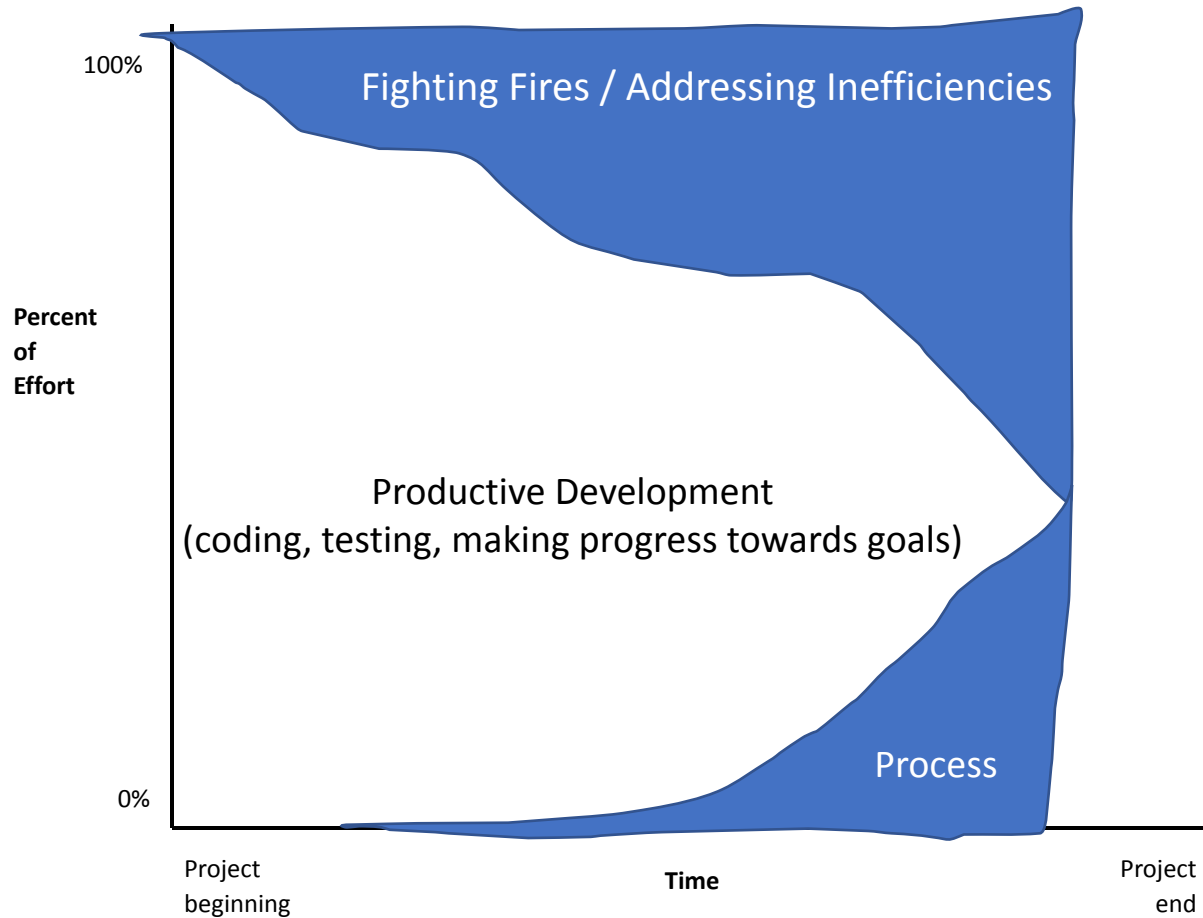

Your manager asks you to follow a process

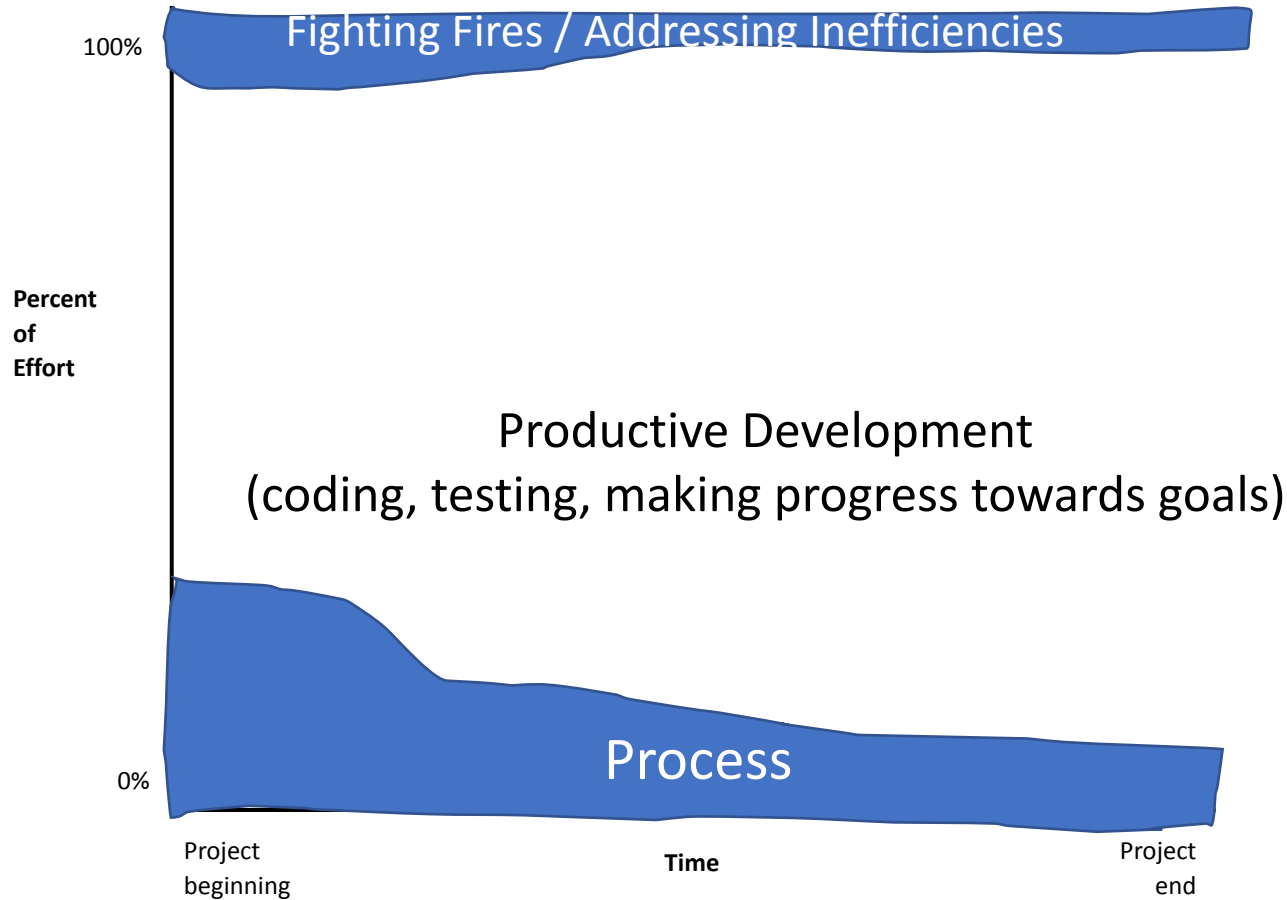

- Writing down all requirements
- Require approval for all changes to requirements
- Use version control for all changes
- Track all reported bugs
- Review requirements and code
- Break down development into smaller tasks and schedule and monitor them
- Planning and conducting quality assurance
- Have daily status meetings
- Use Docker containers to push code between developers and operation

Example process issues

- Change Control: Mid-project informal agreement to changes suggested by customer or manager. Project scope expands 25-50%
- Quality Assurance: Late detection of requirements and design issues. Test-debug-reimplement cycle limits development of new features. Release with known defects.
- Defect Tracking: Bug reports collected informally, forgotten
- System Integration: Integration of independently developed components at the very end of the project. Interfaces out of sync.
- Source Code Control: Accidentally overwritten changes, lost work.
- Scheduling: When project is behind, developers are asked weekly for new estimates.

Hypothesis: Process increases flexibility and efficiency

Ideal Curve: Upfront investment for later greater returns

Planning

Time estimation

THE AUTHOR OF THE WINDOWS FILE COPY DIALOG VISITS SOME FRIENDS.

<https://xkcd.com/612/>

Activity: Estimate Time

Task A: Simple web version of the Monopoly board game with San Diego street names

Team: just you

Task B: Bank smartphone app

Team: you with team of 4 developers, one experienced with iPhone apps, one with background in security

* Estimate in 8h days (20 work days in a month, 220 per year)

My Task A estimate: ____

My Task B estimate: ____

Other Task A estimate: ____

Other Task B estimate: ____

Other Task A estimate: ____

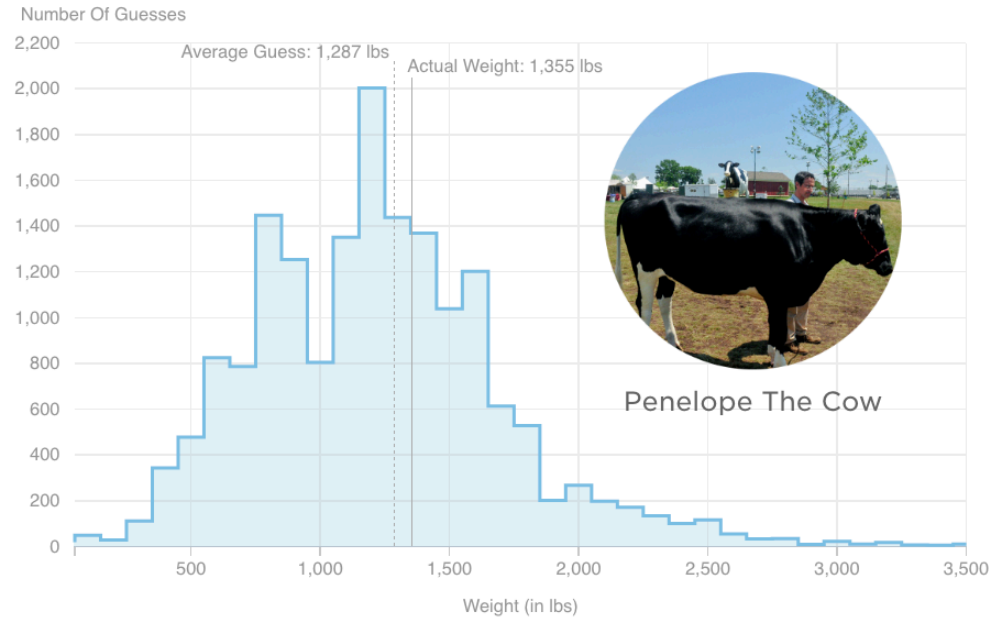

Other Task B estimate: ____

Revise Time Estimate

- Do you have comparable experience to base an estimate off of?
- How much design do you need for each task?
- Break down the task into ~5 smaller tasks and estimate them.
- Revise your overall estimate if necessary

How Much Does This Cow Weigh?

Measuring Progress?

- “I’m almost done with the app. The frontend is almost fully implemented. The backend is fully finished except for the one stupid bug that keeps crashing the server. I only need to find the one stupid bug, but that can probably be done in an afternoon. We should be ready to release next week.”

Measuring Progress?

- Developer judgment: x% done
- Lines of code?
- Functionality?
- Quality?

Milestones and deliverables make progress observable

Milestone: clear end point of a (sub)tasks

- For project manager
- Reports, prototypes, completed subprojects
- "80% done" not a suitable mile stone

Deliverable: Result for customer

- Similar to milestone, but for customers
- Reports, prototypes, completed subsystems

Waterfall model was the original software process

Waterfall diagram CC-BY 3.0 [Paulsmith99](#) at [en.wikipedia](#)

... akin to processes pioneered in mass manufacturing
(e.g., by Ford)

Lean production adapts to variable demand

Toyota Production System (TPS)

Build only what is needed, only when it is needed.

Use the “pull” system to avoid overproduction. (Kanban)

Stop to fix problems, to get quality right from the start (Jidoka)

Workers are multi-skilled and understand the whole process; take ownership

Taiichi Ohno

Lots of software buzzwords invented recently build on these ideas

Just-in-time, DevOps, Shift-Left
